Mobile Phone Thieves Beware! Your Day of Reckoning Has Arrived!

Singapore, 5th July – You read the above headline right. If you have lost or had your mobile phone stolen before, put your hands up. I am sure most of us have in one instance or another. This is where the WaveSecure technology comes in. First, you have to install the software onto your phone, then log into the website to register your mobile phone. In the event that your mobile gets lost or stolen, you can lock your phone remotely from the server thus rendering it useless to the person who took/stole it. Once your phone is locked, you are able to track whichever new SIM card is inserted into your phone and catch the bugger! Besides that, you can also backup your data and restore it onto a new phone if you don't happen to ever get your phone back OR wipeout your data! Log onto <http://www.wavesecure.com> to find out more or register for a free period of time.

>>The phone is locked! Only you can unlock it!
