THIS MONTH:

safe & sound

Protect your mobile phone and your data from theft or loss with a new service. Consider it phone insurance.

what is wavesecure?

WaveSecure is a mobile phone security service designed to protect your handset and the data in it against theft and loss. It was launched by TenCube, a Singapore-based local setup that provides mobile security to local corporations.

why you need it

Your mobile phone is more than just a phone – it's your address book, contact list, organiser and camera, and even holds your e-mails. With so much data stored in your phone, protecting yourself against theft or loss is crucial. Consider it insurance for your mobile phone and data.

what can it do?

WaveSecure allows you to remotely lock your phone if you lose it, and remains locked even if someone changes the SIM card or restarts the phone, rendering it useless to anyone who picks it up. You can also customise a message offering a

reward or giving contact details so the phone may be returned to you. If the SIM card is changed, the service will monitor the new number, as well as any calls or messages received or made, to help track down your phone. A backup of your phone data can also be transferred to WaveSecure's server if you want – allowing you to access, transfer or restore data.

can it run on any mobile phone?

It can be installed on phones with Windows Mobile or Symbian operating systems, which is present in most leading brands and models.

how do you subscribe?

It's free for the first three months – just request for an invitation code from TenCube through www.wavesecure.com. If you choose to continue subscribing to the service, it will likely cost you only about as much as caller ID. **SH**
